COMMENT LETTER

Federal Deposit Insurance Corporation

*Agency Information Collection Activities: Proposed Information Collection
Reporting Forms and Instructions Associated With Requirements and Standards for
FDIC-Supervised Permitted Payment Stablecoin Issuers*

OMB Control No. 3064-0225 · 91 FR 45274 (July 20, 2026)

September 16, 2026

Comment Period Closes: September 18, 2026

I. Introduction and Scope

DDCP Foundation, Inc. (the “Foundation”), a Wyoming nonprofit corporation, respectfully submits this comment on the Federal Deposit Insurance Corporation’s notice and request for comment concerning a proposed information collection comprising weekly and quarterly reporting forms for FDIC-supervised permitted payment stablecoin issuers (“PPSIs”), published at 91 FR 45274 (July 20, 2026), OMB Control No. 3064-0225. The collection comprises FDIC Reporting Form PS-01, the full weekly form; Form PS-01a, the abridged weekly form for smaller issuers; and Form PS-02, the quarterly form. This comment addresses the two weekly forms only.

The Foundation’s interest, stated plainly. The Foundation fosters and stewards the development and maintenance of the protocol infrastructure on which the DDCP protocol operates. It is not a PPSI and does not intend to become one. DDUSD, LLC (in formation) is the prospective PPSI that intends to issue a U.S. dollar-denominated payment stablecoin on the DDCP protocol; it would be supervised by the Office of the Comptroller of the Currency and would not fall within the population to which this collection applies. The Foundation therefore claims no supervisory nexus with the FDIC and does not present itself as a prospective respondent.

It submits this comment for a different reason. The Foundation has filed a comment on the OCC’s corresponding information collection (OMB Control No. 1557–NEW, published at 91 FR 35795 on June 12, 2026). Having compared the two collections item by item, the Foundation observes that the FDIC’s Form PS-01 and the OCC’s Form PS-01 are closely comparable instruments, and that several of the specifications addressed below appear in both in substantially

identical terms. Where that is so, a clarification adopted by one agency alone would create divergence between two regimes that are presently aligned. The Foundation accordingly places corresponding observations before both agencies, so that either may act on them without that consequence.

Scope. This comment is narrow. It addresses five matters: the materiality thresholds and aggregate reporting line proposed for Form PS-01a, which the Foundation supports and on which the FDIC has invited comment; the unit in which Schedule A item 1 is specified, and an alternative drawn from the reporting issuer’s own records; the application of the two mechanisms to Form PS-01; the specification of Schedule A item 2; and the specification of the secondary market bid/ask spread. It concludes with an observation on the published burden estimates. The Foundation takes no position on any other item in either form, and none on Form PS-02.

II. Support for the Materiality Thresholds and the Aggregate Line in Form PS-01a

The FDIC has invited comment on whether the eligibility criteria for Form PS-01a are appropriate. The Foundation supports the criteria as proposed, and supports more strongly two features of the form’s design that are, in its submission, of greater consequence than the eligibility question itself.

The materiality thresholds. Schedule A item 1 of Form PS-01a collects only the ten largest payment stablecoin wallet addresses that exceed 2 percent of total outstanding issuance. Schedule A item 2 collects only the ten largest addresses that exceed 10 percent of weekly gross buy or gross sell volume. Schedule B item 1 collects only the ten largest blockchains exceeding 2 percent of total outstanding issuance.

The Foundation submits that thresholds of this kind are well founded. The supervisory content of a concentration item lies in the positions large enough to bear on concentration. A position below a stated materiality threshold does not inform that assessment, and its collection is burden without corresponding utility. A threshold also produces a collection whose size is a function of the market rather than of an arbitrary row count: where holdings are genuinely dispersed, few rows are reported, which is itself the supervisory answer.

The aggregate line. Schedule B item 1 of Form PS-01a is constructed in three parts: an enumeration of the blockchains exceeding the threshold, a single aggregate line for all others, and a total. The Foundation submits that this is a materially better reporting structure than an enumeration standing alone, for a reason that is independent of burden. A report constructed as enumeration, residual and total reconciles by arithmetic. The agency receives not only the reported rows but confirmation that those rows account for the population from which they are drawn. An enumeration standing alone offers no such confirmation: the agency cannot tell from the report whether the rows are complete, and neither can the respondent demonstrate that they are.

The eligibility criteria. The Foundation supports the proposed criteria — less than \$1 billion in total outstanding issuance value as most recently reported on Form PS-02, and less than \$100 million in average daily transaction volume in the prior month — together with the FDIC’s retention of the ability to require the full form on the basis of supervisory need. It respectfully submits one refinement: that the volume-based criterion be defined by reference to primary

market issuance and redemption, which every reporting issuer generates directly from its own transaction records, rather than by reference to a trading or transfer volume measure. A volume measure drawn from trading venues depends on which venues are counted and on the data source used, and a measure drawn from the ledger is dominated by exchange-internal rebalancing, bridge movements and liquidity pool operations, for the reasons described at Section V below. Either would produce figures that differ between respondents for reasons unrelated to their size, and the Foundation submits that an eligibility test is better founded on a quantity every respondent computes the same way from its own records.

III. Schedule A, Item 1 — The Unit, and an Alternative Drawn From the Reporting Issuer's Records

Schedule A item 1 of Form PS-01 collects the 100 largest payment stablecoin wallet addresses by total outstanding payment stablecoins held at end of day, for each calendar day of the reporting period. Form PS-01a collects the corresponding item at reduced scale. The FDIC describes the schedule as collecting information on stablecoin ownership concentration.

The address and the holder are distinct units. A single person may control any number of addresses, and nothing in the collection would disclose that those addresses are commonly controlled. Conversely, a single address may hold payment stablecoins on behalf of a large number of unrelated persons. For a payment stablecoin in general circulation, the addresses holding the largest balances are predominantly infrastructure addresses: omnibus accounts operated by centralized exchanges, bridge contracts, and liquidity pool addresses associated with automated market makers, each aggregating the positions of many persons who have no relationship with one another. A ranking by address accordingly overstates dispersion where one person's holdings are distributed across addresses, and overstates concentration where an address is an omnibus. A list of the largest addresses is not a list of the largest holders, and the collection contains no attribution information that would permit the FDIC to convert the one into the other.

The Foundation does not submit that address-level data is without analytical use, and acknowledges that movement of a large position between addresses may precede a redemption. Its submission is narrower: the item does not produce the ownership concentration information the schedule is described as collecting.

A limit on the available remedies. The Foundation notes one course that would not be open. A reporting issuer holds no attribution information for addresses in the secondary market: it has no relationship with the persons who control them, no record of who they are, and no means of obtaining one. Conforming the item to an ownership concentration purpose by requiring reporting issuers to supply attribution is therefore not available, because the information does not exist in any respondent's records to be supplied.

A unit the reporting issuer can report exactly. Every PPSI conducts primary market issuance and redemption through a bounded set of counterparties with which it maintains formal relationships and which it has identified under its own customer identification program. Those counterparties are known by legal name, their transactions with the issuer are recorded in its own books, and the figures are verifiable against its accounting records. This is the same named-entity unit the form already employs at Schedule A item 3, which collects exchange names, and at Schedule A item 5, which collects counterparty names.

The measures proposed. For each primary market counterparty exceeding a stated materiality threshold, identified by full legal name: (i) gross issuance to and gross redemption by that counterparty during the reporting period; and (ii) the cumulative net primary market position of that counterparty, being cumulative issuance to it less cumulative redemption by it. Together with an aggregate line for all counterparties below the threshold and a total, on the three-part structure described at Section II, reconciling to the issuance and redemption figures reported at Schedule B. Where a counterparty exceeding the threshold is a natural person, the Foundation respectfully submits that an identifier assigned by the reporting issuer, in place of the full legal name, would serve the same supervisory purpose, and notes that this observation applies equally to the corresponding request before the OCC.

What these measures capture, and what they do not. These are measures of primary market channel concentration. They record how much of the reporting issuer's issuance and redemption activity passes through each counterparty. They do not purport to measure the payment stablecoins a counterparty holds at any point in time: a counterparty that has drawn payment stablecoins from the primary market will ordinarily have distributed a substantial portion of them to its own customers and into the secondary market, and the cumulative net figure will exceed its holdings, frequently by a wide margin. The Foundation states this expressly because a measure presented as a holdings measure while in fact measuring something else would reproduce the difficulty described above. It proposes no substitute measure of holder concentration, and respectfully submits that none is available with precision from the reporting issuer's records, from a ranking of addresses, or from any third-party source in a form a respondent could verify.

Why the measure is material. A payment stablecoin comes under pressure when payment stablecoins are presented to the issuer for redemption in volume, and the rate at which that pressure can be met is the operative question. The pressure arrives through the primary market counterparties, whoever holds the payment stablecoins at the moment it begins: the counterparty is the conduit through which the position unwinds, and the volume that ordinarily passes through it measures the capacity that conduit represents. That exposure is exactly knowable from the reporting issuer's own transaction records, on identical terms from every PPSI, and is not presently collected.

Consistency between the two collections. Schedule A item 1 is specified in substantially identical terms in the OCC's Form PS-01, and the Foundation has made the same request of the OCC. It respectfully submits that a change of unit adopted by one agency alone would create divergence in the most basic reporting unit of the two regimes, and that the question is accordingly best considered by both.

IV. Application of the Two Mechanisms to Form PS-01

The Foundation respectfully submits that neither the materiality threshold nor the aggregate line is properly understood as a concession to smaller issuers. Each is a sound feature of reporting design whose rationale holds at any scale, and each would improve Form PS-01.

Threshold. Schedule A item 1 of Form PS-01 collects the 100 largest wallet addresses by holdings, for each calendar day of the reporting period — as many as 700 address-and-balance observations in each weekly filing. Applying a materiality threshold would remove the great majority of those rows without removing any position capable of affecting the concentration

assessment the item is intended to support. Nothing in the rationale for the threshold is specific to issuers below \$1 billion in outstanding issuance.

Aggregate line. The Foundation notes an asymmetry within Form PS-01a itself. Schedule B item 1 of that form is constructed in three parts, as described above. Schedule A item 1 is constructed in one: the enumeration alone, with no aggregate line and no total. The same asymmetry appears in Form PS-01.

The Foundation respectfully submits that Schedule A item 1 would be improved by carrying the three-part structure in both forms. The residual is derivable by subtraction — total outstanding issuance, which is independently reported at Schedule B, less the sum of the enumerated positions — and it costs the respondent a single derived cell. The resulting report is complete by construction and gives the FDIC a reconciliation check that the present structure does not provide.

V. Schedule A, Item 2 — Largest Wallet Addresses by Trading Volume

Schedule A item 2 of Form PS-01 requires a reporting issuer to identify the 100 largest payment stablecoin wallet addresses by daily trading volume, reporting for each the daily gross buy volume and the daily gross sell volume, without netting, for each calendar day of the reporting period. Form PS-01a collects the corresponding item at reduced scale, being the ten largest addresses exceeding 10 percent of weekly gross buy or gross sell volume.

Footnote 1 to the Form PS-01 instructions states that the FDIC proposes to define “trading volume” as the aggregate number of payment stablecoins issued by a PPSI that were purchased or sold on exchanges during a specified period of time. The corresponding footnote to the OCC’s Form PS-01 instructions adopts the same definition in the same terms.

The Foundation respectfully submits that this item requests information that a reporting issuer does not generate and has no means of obtaining from any source within its control.

Trading on a centralized exchange is executed against that exchange’s internal order book, and the execution records are the exchange’s records. A substantial share of that activity nets internally and produces no ledger transaction, so no address is associated with it at all. Where an exchange does settle on the ledger, the transaction is associated with the exchange’s own addresses rather than with the addresses of the persons who traded. A reporting issuer has no contractual relationship with the exchanges on which its payment stablecoin trades, no entitlement to their execution data, and no basis on which to attribute exchange-executed purchases and sales to particular addresses.

Conversely, transfers between addresses on the ledger are observable but are not, under the proposed definition, trading volume, because they were not purchased or sold on an exchange. The quantity the item requests is therefore neither the ledger activity associated with an address nor the whole of the exchange activity in the payment stablecoin.

Completion would require a reporting issuer to procure third-party blockchain analytics services and, for the centralized venue component, data held by venues under no obligation to provide it. Any figure so produced would be an estimate derived from a vendor’s proprietary attribution

methodology, would not be verifiable against the reporting issuer's own records, and would not be comparable across respondents using different vendors.

The threshold in Form PS-01a does not cure the difficulty. The 10 percent threshold reduces the volume of the collection substantially, and the Foundation supports thresholds of that kind generally, as set out at Section II. It does not, however, address the difficulty described above, which concerns the availability of the data rather than the number of rows. A reporting issuer with no means of attributing exchange-executed activity to addresses is in the same position whether the item calls for ten addresses or a hundred.

Redefinition would not cure it either. Redefining the measure by reference to activity observable on the ledger — whether described as transfer volume, transaction volume or transaction count — would not resolve the item. Activity of that kind for a payment stablecoin is dominated by exchange-internal rebalancing, bridge movements and liquidity pool operations; it measures ledger activity rather than economic activity by any person, and is a well-understood overstatement of market participation. It would also be a different quantity from that collected by items 3 and 4, which would break comparability within Schedule A and prevent reconciliation across the schedule.

Schedule A items 3 and 4 already collect trading volume at the exchange level, from the entities that hold the execution data and that can be identified by legal name. The Foundation respectfully requests that Schedule A item 2 be removed from both Form PS-01 and Form PS-01a, and that items 3 and 4 be retained.

VI. Secondary Market Bid/Ask Spread

Schedule B item 2.e of Form PS-01 requires the reporting issuer to report the average of the difference between end-of-day ask prices and bid prices across the top 15 exchanges listed in Schedule A item 3, to the sixth decimal place, for each calendar day. Form PS-01a collects the same measure at Schedule B item 3.e. The OCC's Form PS-01 specifies the item in substantially the same terms.

Schedule A item 3 expressly encompasses both centralized and decentralized exchanges, and the top fifteen venues by volume for a payment stablecoin will ordinarily include decentralized venues. The predominant decentralized exchange design is the automated market maker, in which price is determined algorithmically by the composition of a liquidity pool and the size of the trade, and in which there is no order book, no resting bid and no resting ask. A bid/ask spread is not a defined quantity for such a venue.

The item accordingly requests a measure that does not exist for a category of venue the form expressly contemplates. Any figure a respondent reported for that portion of the venue population would be a construct of its own devising, defined differently by each respondent and not comparable across the population — which is the opposite of what a standardized reporting form is intended to produce.

A related point arises on the volume-weighted average price at item 2.c, computed across the same mixed venue population. That figure aggregates prices formed by materially different mechanisms. It remains usable for peg-deviation monitoring, which appears to be the purpose, but the methodology warrants specification so that respondents compute it consistently.

These items warrant specification, not removal. The Foundation distinguishes these measures from Schedule A item 2. Price and spread data are generated by trading venues and are commercially available from market data vendors: the difficulty is one of specification and cost. The per-address attribution required by Schedule A item 2 is not available from any source, at any cost, in a form a respondent could verify. The Foundation accordingly asks for different remedies in the two cases.

The Foundation respectfully requests that the FDIC (i) specify that the bid/ask spread item is computed across centralized venues only, or in the alternative specify a defined proxy methodology for automated market maker venues; (ii) specify the computation methodology for the volume-weighted average price and peg deviation items across mixed venue populations; and (iii) confirm that a reporting issuer may report these items from a named third-party market data source, identifying that source, rather than being understood to warrant execution data it does not generate.

VII. The Published Burden Estimates

Form PS-01a states on its face that the estimated average burden of implementing the weekly reporting requirement is sixteen hours per respondent annually, and that the estimated average ongoing burden is two hours per response. The FDIC's notice states the same figures for Form PS-01.

The two forms are instruments of materially different scope. Form PS-01 comprises eight schedules completed with daily data: as many as 1,400 address-level observations each week on Schedule A alone, together with per-blockchain issuance and redemption detail, five secondary market pricing measures to the sixth decimal place, fifteen columns for each of six reserve asset categories, CUSIP-level detail for every Treasury security held with custodian, sub-custodian and jurisdiction, counterparty and collateral detail for every repurchase and reverse repurchase agreement, and fund-level detail for every money market mutual fund held. Form PS-01a comprises three schedules completed on a weekly basis: at most ten threshold-qualifying addresses on each of two items, ten exchanges, ten blockchains with an aggregate line, and a reserve asset schedule of two columns.

The Foundation respectfully submits that a burden estimate which does not vary between two instruments of that difference in scope has not been derived from either of them. It notes the same pattern in the corresponding OCC collection, where the OCC states expressly that its figures were re-published from its March 2, 2026 notice of proposed rulemaking for informational purposes, and so were not derived from the forms subsequently published. On the present record, no published ongoing estimate in either collection appears to have been derived from the instrument it measures.

The Foundation also notes that no estimate of capital or start-up costs appears, although the collection as specified would require, at a minimum, the procurement of blockchain analytics services and licensed market data.

The Foundation respectfully requests that the FDIC derive separate burden estimates for Form PS-01 and Form PS-01a from the forms as published; include an estimate of capital and start-up costs; and publish the revised estimates in the 30-day notice, so that they are available for comment before the collection is submitted to the Office of Management and Budget.

VIII. Conclusion and Modifications Respectfully Requested

DDCP Foundation, Inc. submits this comment as protocol steward, and as a commenter on the corresponding OCC collection. It respectfully requests the following.

1. That the materiality thresholds proposed for Form PS-01a be retained, that the eligibility criteria be adopted as proposed, and that any volume-based eligibility criterion be defined by reference to primary market issuance and redemption rather than to trading or transfer volume.
2. That Schedule A item 1 be replaced with the primary market channel concentration measures described at Section III, the Foundation noting expressly that those measures are not a measure of holdings and that holdings concentration is not available with precision from any source.
3. That, in the alternative, if an address-level collection is retained, Schedule A item 1 of both Form PS-01 and Form PS-01a be constructed on a three-part basis — an enumeration subject to a materiality threshold, an aggregate line for the remainder of the population, and a stated total — matching the structure already used at Schedule B item 1 of Form PS-01a.
4. That Schedule A item 2 be removed from both forms and Schedule A items 3 and 4 retained; and that the measure not be redefined by reference to activity observable on the ledger, however described.
5. That the venue population and computation methodology for the secondary market pricing items be specified; that the bid/ask spread item be limited to centralized venues or a defined proxy specified for automated market maker venues; and that reporting from an identified third-party market data source be confirmed as permissible. The Foundation does not request the removal of these items.
6. That separate burden estimates be derived for Form PS-01 and Form PS-01a from the forms as published, that an estimate of capital and start-up costs be included, and that the revised estimates be published in the 30-day notice.

The Foundation notes that the matters raised at Sections V and VI arise in substantially identical terms in the OCC's corresponding collection at OMB Control No. 1557–NEW, on which it has filed a comment addressing them. It respectfully submits that a clarification adopted by both agencies would preserve the alignment the two collections presently have, and would reduce implementation cost for issuers and for the vendors serving both supervised populations.

The Foundation appreciates the FDIC's consideration of these comments and would welcome the opportunity to provide any further information that would assist the agency.

Respectfully submitted,

DDCP Foundation, Inc.
