COMMENT LETTER

*Office of the Comptroller of the Currency
Reporting Forms and Instructions for Permitted Payment Stablecoin Issuers
Subject to the Jurisdiction of the Office of the Comptroller of the Currency*

OMB Control No. 1557–NEW · 91 FR 35795 (June 12, 2026)

August 6, 2026

Comment Period Closes: August 11, 2026

I. Introduction

DDCP Foundation, Inc. (the “Foundation”), a Wyoming nonprofit corporation, respectfully submits this comment on the Office of the Comptroller of the Currency’s notice and request for comment concerning a proposed new information collection comprising weekly and quarterly reporting forms for permitted payment stablecoin issuers (“PPSIs”) and foreign payment stablecoin issuers, published at 91 FR 35795 (June 12, 2026), OMB Control No. 1557–NEW. The proposed forms and their instructions were published as OCC Reporting Form PS-01, Payment Stablecoin Activity and Reserve Weekly Reporting, and OCC Reporting Form PS-02, Permitted Payment Stablecoin Issuer and Foreign Payment Stablecoin Issuer Reports of Condition and Income, through OCC Bulletin 2026-24.

The Foundation fosters and stewards the development and maintenance of the protocol infrastructure on which the DDCP protocol operates. The Foundation is not a PPSI and does not intend to become one. DDUSD, LLC (in formation) is the prospective PPSI that intends to issue a U.S. dollar-denominated payment stablecoin on the DDCP protocol and to seek a license from the OCC; it would be the entity completing the reporting forms addressed in this comment.

The Foundation’s interest arises from its role as steward of the protocol infrastructure on which DDUSD, LLC intends to issue. Its concern is accordingly with the specification of the collection rather than with any substantive regulatory obligation: whether the collection produces the supervisory information the OCC has identified as its objective, and whether each item is specified in a unit a reporting issuer can obtain and verify.

The Foundation has filed comments in five related proceedings: the OCC’s primary PPSI rulemaking at Docket OCC-2025-0372 (Comment IDs OCC-2025-0372-0257, filed May 1, 2026; OCC-2025-0372-0349, filed May 20, 2026; and OCC-2025-0372-0354, filed June 12,

2026); the Financial Crimes Enforcement Network and Office of Foreign Assets Control proposed rule at Docket FINCEN-2026-0100; Docket FINCEN-2026-0034; the Department of the Treasury at Docket TREAS-DO-2026-0232; and the Federal Deposit Insurance Corporation at RIN 3064-AG19. This comment does not restate those filings and does not address any question of substantive regulatory obligation. It addresses the information collection only.

II. Scope and Summary

This comment addresses the weekly reporting form, Form PS-01.

The subjects on which comment is invited. The notice invites comment on five subjects, which it letters (a) through (e): the necessity of the collection for the proper performance of the OCC's functions, including the practical utility of the information; the accuracy of the OCC's burden estimate; ways to enhance the quality, utility and clarity of the information collected; ways to minimize the burden of the collection on respondents; and estimates of capital or start-up costs. References below to items (a) through (e) are to those subjects.

What the Foundation supports. Schedules C through H, which collect reserve asset detail, are drawn from records every PPSI maintains and are appropriately specified for the reserve adequacy purpose the notice identifies. Schedule B item 1, which collects outstanding issuance value, issuances, redemptions and removals from circulation by blockchain, and Schedule B items 3 and 4, which collect liquidity and redemption measures, are drawn from the reporting issuer's own books and are, in the Foundation's view, the most directly probative items in the weekly form for the supervisory purpose the notice describes. Schedule A items 3, 4 and 5 collect exchange-level trading data and counterparty exposure in units that can be named and that are held by parties who generate the underlying information.

What this comment addresses.

- (1) Schedule A item 1 collects, for each calendar day, the 100 largest wallet addresses by holdings. The notice describes the item as collecting information on the largest holders of the payment stablecoin. The Foundation respectfully submits that the address is not the holder, that the collection supplies no attribution connecting the two, and that the information the notice describes is collected elsewhere in the same form (Section III).
- (2) Schedule A item 2 collects, for each calendar day, the 100 largest wallet addresses by daily gross buy and sell volume as executed on exchanges. The Foundation respectfully submits that no PPSI generates or has access to this information, and that Schedule A items 3 and 4 already collect exchange-level volume from the entities that do (Section IV).
- (3) An alternative specification for both items, drawn from the reporting issuer's own records, together with two reporting mechanisms already in use in the corresponding FDIC collection, is set out at Section V.
- (4) Schedule B items 2.a through 2.e collect secondary market price and spread measures across the top fifteen exchanges. One of those measures is not a defined quantity for a category of venue the form expressly contemplates. The Foundation asks that these items be specified, not removed (Section VI).

(5) No published ongoing burden estimate in this collection, or in the corresponding collection proposed by the Federal Deposit Insurance Corporation, appears to have been derived from the instrument it measures (Section VII).

(6) The collection applies a single eight-schedule daily-data form to every OCC-supervised PPSI without regard to scale, at a time when the FDIC has proposed a scaled alternative for the corresponding population it supervises (Section VIII).

(7) The submission format, one drafting matter and one additional item warrant attention (Section IX).

Section X classifies the remaining questions raised in the notice. Section XI states the modifications respectfully requested.

A note on method. At several points this comment refers to the corresponding collection proposed by the Federal Deposit Insurance Corporation for FDIC-supervised PPSIs, published July 20, 2026 at 91 FR 45274 (OMB Control No. 3064-0225). The Foundation has compared the two full weekly forms and their instructions, and has reviewed FDIC Form PS-01a, the abridged weekly form for smaller issuers. The references serve two purposes: to identify specifications that appear in both collections, where a clarification adopted here would preserve consistency between the two; and to calibrate the burden estimate against a contemporaneous estimate for a closely comparable instrument. The Foundation intends to submit comparable observations on the FDIC's collection.

III. Schedule A, Item 1 — Largest Wallet Addresses by Holdings

A. What the Item Collects

Schedule A item 1 of Form PS-01 requires a reporting issuer to identify the 100 largest payment stablecoin wallet addresses by total outstanding payment stablecoins held at end of day, reporting for each the alphanumeric address and the number of payment stablecoins held. Under the general instructions to Form PS-01, this item, like the remainder of the form, is completed for each calendar day of the reporting period. A reporting issuer would therefore submit as many as 700 address-and-balance observations in each weekly filing, for each payment stablecoin it issues.

The notice states the supervisory purpose as monitoring primary and secondary market dynamics, including during times of stress, and expressly invites comment on whether this is the right type of information, whether adjustments would make it more valuable or less burdensome, and whether the agency should collect a smaller number of wallet addresses.

B. The Item Does Not Produce the Information the Notice Describes

The notice describes item 1 as collecting information on the largest holders of the payment stablecoin, listed by wallet address. The Foundation respectfully submits that the address and the holder are distinct units, and that the difference bears directly on whether the item delivers the information the notice describes.

A single person may control any number of addresses, and nothing in the collection would disclose that those addresses are commonly controlled. Conversely, a single address may hold

payment stablecoins on behalf of a large number of unrelated persons. For a payment stablecoin in general circulation, the addresses holding the largest balances are predominantly infrastructure addresses: omnibus accounts operated by centralized exchanges, bridge contracts, and liquidity pool addresses associated with automated market makers. Each of those aggregates the positions of many persons who have no relationship with one another. A ranking by address accordingly overstates dispersion where one person's holdings are distributed across addresses, and overstates concentration where an address is an omnibus.

The Foundation does not submit that address-level data is without analytical use. A series of address-level balances, observed over time and in aggregate, may support useful observation of flows on the ledger. The Foundation's submission is narrower, and directed to item (a): the collection does not produce the information the notice says it collects. A list of the 100 largest addresses is not a list of the 100 largest holders, and the collection contains no attribution information that would permit the OCC to convert the one into the other.

Where a collection is justified on a stated rationale that the instrument does not deliver, the Foundation respectfully submits that the appropriate course is either to conform the instrument to the stated purpose or to articulate the alternative purpose the instrument does serve, so that the necessity and the burden of the collection may be assessed against that purpose. Observation of flows on the ledger is a different objective from monitoring holder composition. It is not the rationale stated for item 1, and it has not been assessed for practical utility or burden on its own terms.

A limit on the available remedies. The Foundation notes one course that would not be open. A reporting issuer holds no attribution information for addresses in the secondary market: it has no relationship with the persons who control them, no record of who they are, and no means of obtaining one. Conforming the instrument to the holder-composition purpose by requiring reporting issuers to supply attribution is therefore not available, because the information does not exist in any respondent's records to be supplied.

C. The Information Sought Is Collected Elsewhere in the Same Form

The notice identifies the purpose as monitoring primary and secondary market dynamics, including during times of stress. Form PS-01 collects each of those, comprehensively, from sources that generate the underlying data.

Primary market dynamics. Schedule B item 1 collects, by blockchain and for each calendar day, outstanding issuance value at beginning of day, gross issuance, gross redemption, removals from circulation and restricted balances. Schedule B item 3 collects payment stablecoins purchased but not yet minted, payment stablecoins tendered for redemption but not yet paid, average redemption time, and the total dollar amount of redemptions for which transfer of funds was not initiated within 48 hours. Schedule B item 4 collects the minimum, maximum and average redemption amount for each day. These items describe the primary market completely, and they are drawn from the reporting issuer's own books.

Secondary market dynamics. Schedule A item 3 collects the top 100 centralized or decentralized exchanges by daily trading volume, by full legal name, and item 4 collects the daily total across all exchanges. Schedule B item 2 collects the daily minimum and maximum executed price, the volume-weighted average price, the peg deviation and the spread. These

items are drawn from the venues on which the secondary market operates. (The Foundation's observations on the specification of Schedule B item 2 are at Section VI; it does not request the removal of those items, and relies on them here as collected.)

Stress. Full reserve backing eliminates solvency risk. It does not eliminate the risk that reserve assets must be converted to cash on short notice — Treasury securities sold into a market that may itself be dislocated, repurchase positions unwound, money market fund holdings redeemed subject to fund-level constraints. Redemption pressure is the channel through which reserve composition risk is realized, which is why the form devotes Schedules C through H to reserve composition, maturity, liquidity and collateral, and why Schedule B item 3 collects the timing and backlog of redemptions alongside their volume. The stress signal is therefore already collected, at both ends of the mechanism.

Duplication within Schedule A. Because exchange and venue addresses will constitute a substantial share of the addresses holding the largest balances, item 1 will to a significant extent restate, in an anonymous alphanumeric unit, information that item 3 already collects in a named and directly usable one. The Foundation does not submit that the residual — those addresses in item 1 that are not exchange or venue addresses — is without content. It submits that the residual is precisely the portion the reporting issuer has no means of attributing to any person; that whatever value it carries rests on the flow-observation rationale rather than on the holder-composition rationale the notice states; and that the volume of the collection should be weighed against that residual rather than against the item as a whole. Schedule A items 1 and 2 together produce as many as 1,400 address-level observations in each weekly filing.

The incremental content of the item. The Foundation acknowledges one respect in which item 1 carries content the reporting issuer's own records do not. Movement of a large position between addresses can precede a redemption, and a daily series of address balances may therefore disclose pre-positioning before that pressure reaches the redemption window. The Foundation does not dispute that content; it makes three observations about it. First, movement of that kind is dominated by routine rebalancing among exchange, bridge and liquidity pool addresses, so that whatever signal exists is carried within a large volume of activity that is not signal. Second, the movement is not attributable to any person, for the reasons given at Section III.B, so the agency observes that a position moved without observing who moved it. Third, and most practically, net movement between the largest positions and the remainder of the population is preserved under the reporting structure described at Section V, at materially lower volume: an enumeration reported alongside an aggregate residual and a stated total discloses period-to-period movement between the two.

A measure that is not collected at all. The Foundation further submits that a measure closely connected to redemption pressure is absent from the form: the concentration of the reporting issuer's issuance and redemption traffic among the counterparties through which it passes. Every PPSI knows this with precision from its own transaction records. It is described at Section V.

D. Modification Respectfully Requested

The Foundation respectfully requests that the OCC replace Schedule A item 1 with the primary market channel concentration measures described at Section V, which are drawn from the reporting issuer's own transaction records and reported in the same named-entity unit already employed in Schedule A items 3 and 5.

IV. Schedule A, Item 2 — Largest Wallet Addresses by Trading Volume

Schedule A item 2 requires a reporting issuer to identify the 100 largest payment stablecoin wallet addresses by daily trading volume, reporting for each address the daily gross buy volume and the daily gross sell volume, without netting, for each calendar day of the reporting period.

Footnote 1 to the instructions states that the OCC proposes to define “trading volume” as the aggregate number of payment stablecoins issued by a permitted payment stablecoin issuer or foreign issuer that were purchased or sold on exchanges during a specified period of time. The corresponding footnote to the FDIC’s Form PS-01 instructions adopts the same definition in the same terms.

The Foundation respectfully submits that this item requests information that a reporting issuer does not generate and has no means of obtaining from any source within its control.

Trading on a centralized exchange is executed against that exchange’s internal order book, and the execution records are the exchange’s records. A substantial share of that activity nets internally and produces no ledger transaction, so no address is associated with it at all. Where an exchange does settle on the ledger, the transaction is associated with the exchange’s own addresses rather than with the addresses of the persons who traded. A reporting issuer has no contractual relationship with the exchanges on which its payment stablecoin trades, no entitlement to their execution data, and no basis on which to attribute exchange-executed purchases and sales to particular addresses.

Conversely, transfers between addresses on the ledger are observable but are not, under the proposed definition, trading volume, because they were not purchased or sold on an exchange. The quantity item 2 requests is therefore neither the ledger activity associated with an address nor the whole of the exchange activity in the payment stablecoin.

Completion would require a reporting issuer to procure third-party blockchain analytics services and, for the centralized venue component, data held by venues that are under no obligation to provide it. Any figure so produced would be an estimate derived from a vendor’s proprietary attribution methodology, would not be verifiable against the reporting issuer’s own records, and would not be comparable across respondents using different vendors. This constraint applies to the entire respondent population and is independent of token design.

Schedule A items 3 and 4 already collect trading volume at the exchange level, from the entities that hold the execution data and that can be identified by legal name, and item 3 supplies the venue population used by the Schedule B pricing items.

Redefinition would not cure the difficulty. The Foundation respectfully submits that redefining the measure by reference to activity observable on the ledger — whether described as transfer volume, transaction volume or transaction count — would not resolve the item, for two reasons. First, activity of that kind for a payment stablecoin is dominated by exchange-internal rebalancing, bridge movements and liquidity pool operations; it measures ledger activity rather than economic activity by any person, and is a well-understood overstatement of market participation. Second, it would be a different quantity from that collected by items 3 and 4, which would break comparability within Schedule A and prevent reconciliation across the schedule.

A materiality threshold would not cure it either. FDIC Form PS-01a collects, for the corresponding item, only the ten largest addresses that exceed 10 percent of weekly gross buy or gross sell volume. That threshold reduces the volume of the collection substantially, and the Foundation supports thresholds of that kind generally. It does not, however, address the difficulty described above, which concerns the availability of the data rather than the number of rows: a reporting issuer that has no means of attributing exchange-executed activity to addresses is in the same position whether the item calls for ten addresses or a hundred.

Modification respectfully requested. The Foundation respectfully requests that the OCC remove Schedule A item 2 and retain items 3 and 4. If the OCC wishes to retain a per-counterparty activity measure, the Foundation respectfully requests that it take the form described at Section V.

V. An Alternative Specification, and Two Mechanisms of Reporting Design

Sections III and IV each conclude that the specified unit — the wallet address — does not carry the supervisory content the notice describes. This section sets out what the Foundation proposes in its place. It begins with two mechanisms of reporting design, which the Foundation proposes be applied both to that alternative and, if the OCC retains an address-level collection, to Schedule A item 1 as set out at Section V.D.

A. Two Mechanisms Already in Use in the Corresponding FDIC Collection

The FDIC’s abridged weekly form, Form PS-01a, employs two mechanisms that appear in neither full weekly form.

A materiality threshold. Schedule A item 1 of Form PS-01a collects only the ten largest wallet addresses that exceed 2 percent of total outstanding issuance; Schedule B item 1 collects only the blockchains exceeding the same threshold. The Foundation submits that thresholds of this kind are well founded and that their rationale is not confined to smaller issuers. The supervisory content of a concentration item lies in the positions large enough to bear on concentration; a position below a stated threshold does not inform that assessment, and its collection is burden without corresponding utility. A threshold also makes the size of the collection a function of the market rather than of an arbitrary row count: where holdings are genuinely dispersed, few rows are reported, which is itself the supervisory answer.

A three-part reporting structure. Schedule B item 1 of Form PS-01a is constructed in three parts: an enumeration of the items exceeding the threshold, a single aggregate line for all others, and a total. Schedule A item 1 of that form, and of both full weekly forms, is constructed in one part — the enumeration alone, with no aggregate line and no total.

The Foundation submits that the three-part structure is materially better reporting design, for a reason independent of burden. A report constructed as enumeration, residual and total reconciles by arithmetic. The agency receives not only the reported rows but confirmation that those rows account for the population from which they are drawn, and, read across consecutive periods, the movement of value between the enumerated positions and the remainder. An enumeration standing alone provides none of that: the agency cannot tell from the report whether the rows are

complete, and the respondent cannot demonstrate that they are. The residual is derivable by subtraction from a total that is independently reported, and it costs the respondent a single derived cell.

B. The Proposed Measures

The unit. Every PPSI conducts primary market issuance and redemption through a bounded set of counterparties with which it maintains formal relationships and which it has identified under its own customer identification program. Those counterparties are known to the reporting issuer by legal name, their transactions with the issuer are recorded in its own books, and the figures are verifiable against its accounting records. This is the same named-entity unit the form already employs at Schedule A item 3, which collects exchange names, and at Schedule A item 5, which collects counterparty names.

The measures. For each primary market counterparty exceeding a stated materiality threshold, identified by full legal name: (i) gross issuance to and gross redemption by that counterparty during the reporting period; and (ii) the cumulative net primary market position of that counterparty, being cumulative issuance to it less cumulative redemption by it. Together with an aggregate line for all counterparties below the threshold, and a total, which reconciles to the issuance and redemption figures reported at Schedule B item 1.

Reporting basis. The Foundation respectfully submits that these measures should be reported as of the weekly reporting date rather than for each calendar day. Counterparty composition does not vary on a daily cycle in the way reserve balances and redemption flows do, and the daily basis is better reserved for the reserve and redemption items where it is material.

C. What These Measures Capture, and What They Do Not

These are measures of primary market channel concentration. They record how much of the reporting issuer's issuance and redemption activity passes through each counterparty. They do not purport to measure the payment stablecoins a counterparty holds at any point in time: a counterparty that has drawn payment stablecoins from the primary market will ordinarily have distributed a substantial portion of them to its own customers and into the secondary market, and the cumulative net figure will exceed its holdings, frequently by a wide margin. The Foundation states this expressly because the distinction bears on how the OCC would use the figures, and because a measure presented as a holdings measure while in fact measuring something else would reproduce the difficulty identified at Section III.B.

The Foundation does not propose a substitute measure of holder concentration, and respectfully submits that none is available with precision. Holdings concentration is not obtainable from the reporting issuer's records, is not obtainable from a ranking of addresses for the reasons given at Section III.B, and is not obtainable from any third-party source in a form a respondent could verify. That is the substance of the Foundation's submission on item 1, and it would not be improved by proposing a proxy that shares the defect.

Why channel concentration is material to the stated purpose. A payment stablecoin comes under pressure when payment stablecoins are presented to the issuer for redemption in volume, and the rate at which that pressure can be met is the operative question. The pressure arrives through the primary market counterparties, whoever holds the payment stablecoins at the moment it begins: the counterparty is the conduit through which the position unwinds, and the

volume that ordinarily passes through it measures the capacity that conduit represents. A counterparty accounting for a large share of a reporting issuer's issuance and redemption traffic is a structural concentration exposure whether or not it holds a large position at end of day. The Foundation does not submit that this displaces every purpose an address-level series might serve. It submits that this is a concentration measure material to redemption pressure, exactly knowable from the reporting issuer's own transaction records, available on identical terms from every PPSI, and not presently collected.

Uniformity. A collection specified in units the reporting issuer generates from its own books — issuance and redemption activity, and its distribution across the counterparties with which it maintains primary market relationships — is drawn from records every PPSI is required to keep and can be verified against the financial statements the same issuer reports on Form PS-02. It does not depend on any characteristic of the ledger, and is therefore available from every respondent on identical terms.

D. If an Address-Level Collection Is Retained

If the OCC retains Schedule A item 1 in an address-level unit, the Foundation respectfully requests that it be constructed using the two reporting mechanisms described at Section V.A: an enumeration of a materially smaller number of addresses subject to a stated materiality threshold, an aggregate line for the remainder of the population, and a stated total, reported on a weekly rather than a daily basis. So constructed, the item reconciles against total outstanding issuance as reported at Schedule B, and discloses period-to-period movement between the enumerated positions and the remainder — the content identified at Section III.C — at a small fraction of the present volume.

The Foundation further respectfully requests that any such enumeration be limited to addresses whose balances the reporting issuer can determine from its own records or from data publicly available on the ledger. A reporting form should not require a respondent to warrant a figure it has no means of computing, and the limit applies on the same terms to every respondent.

VI. Schedule B, Items 2.a Through 2.e — Secondary Market Price and Spread

Schedule B items 2.a through 2.e require the reporting issuer to report, for each calendar day and to the sixth decimal place, the minimum executed transaction price, the maximum executed transaction price, the volume-weighted average price, the volume-weighted average peg deviation, and the average difference between end-of-day ask prices and bid prices. Items 2.a, 2.b, 2.c and 2.e are computed across the top fifteen exchanges listed in Schedule A item 3. The FDIC's Form PS-01 specifies these items in substantially the same terms, computing item 2.d across all exchanges rather than across the top fifteen.

Schedule A item 3 expressly encompasses both centralized and decentralized exchanges, and the top fifteen venues by volume for a payment stablecoin will ordinarily include decentralized venues. The predominant decentralized exchange design is the automated market maker, in which price is determined algorithmically by the composition of a liquidity pool and the size of the trade, and in which there is no order book, no resting bid and no resting ask. A bid/ask spread is not a defined quantity for such a venue. Item 2.e accordingly requests a measure that does not exist for a category of venue the form expressly contemplates, and any figure a respondent

reported would be a construct of its own devising, defined differently by each respondent and not comparable across the population.

Relatedly, a volume-weighted average price computed across a mixed population of centralized order books and automated market maker pools aggregates prices formed by materially different mechanisms. The resulting figure remains usable for peg-deviation monitoring, which appears to be the OCC's purpose, but the methodology warrants specification so that respondents compute it consistently.

A distinction from Schedule A item 2. The Foundation asks that these items be specified rather than removed, and the reason marks the boundary of its submission at Section IV. The price and spread measures in Schedule B item 2 are generated by trading venues and are commercially available from market data vendors: the difficulty they present is one of specification and cost. The per-address attribution required by Schedule A item 2 is not available from any source, at any cost, in a form a respondent could verify. The Foundation's objection in the one case is to availability and in the other to precision of specification, and it asks for correspondingly different remedies.

The Foundation respectfully requests that the OCC (i) specify that item 2.e is computed across centralized venues only, or in the alternative specify a defined proxy methodology for automated market maker venues; (ii) specify the computation methodology for items 2.c and 2.d across mixed venue populations; and (iii) confirm that a reporting issuer may report items 2.a through 2.e from a named third-party market data source, identifying that source, rather than being understood to warrant execution data it does not generate. Because these items are specified in substantially the same terms in the FDIC's corresponding collection, a specification adopted here would preserve consistency between the two.

VII. Accuracy of the Burden Estimate

The notice states that the burden estimates for the weekly and quarterly reporting collections were introduced in the notice of proposed rulemaking published March 2, 2026 at 91 FR 10202, and that this notice "is re-publishing those same estimates here for informational purposes." The estimates therefore predate the reporting forms on which comment is now sought and were not derived from them.

The published figure for ongoing compliance with proposed section 15.14(h) is one hour per weekly response. A single weekly response comprises eight schedules, each completed for every calendar day in the reporting period. In the course of one such response a reporting issuer would produce: up to 100 wallet addresses with balances on each of seven days; up to 100 wallet addresses with separate gross buy and gross sell figures on each of seven days; up to 100 named exchanges with daily volumes; five secondary market price and spread measures to the sixth decimal place across fifteen venues; per-blockchain issuance, redemption, removal, freeze, time-lock and permanent-inaccessibility figures; twelve completed columns for each of six reserve asset categories, including intraday minimum and maximum fair values, amortized cost, tokenization balances, weighted average maturity, weighted average life, effective interest rate, interest income earned and retained, interest income paid to third parties and total monetization; CUSIP-level detail for every U.S. Treasury security held, with custodian, sub-custodian, custody jurisdiction and repurchase encumbrance; counterparty, collateral CUSIP, haircut, maturity and

rehypothecation status for every repurchase and reverse repurchase agreement; and fund-level detail for every money market mutual fund held.

The published figure for initial set-up under section 15.14(h) is sixteen hours. That figure would need to accommodate the design, construction, testing and validation of the systems producing all of the foregoing, integration to OCC BankNet, and the controls necessary to meet a fixed Wednesday 5:00 p.m. Eastern deadline together with a five-calendar-day amendment obligation.

The Foundation also notes that no estimate of capital or start-up costs appears in the notice, although the notice invites comment on that subject at item (e) and the collection as specified would require, at a minimum, the procurement of blockchain analytics services and licensed market data.

Comparison with the corresponding FDIC collection. The FDIC published a corresponding notice on July 20, 2026 at 91 FR 45274 (OMB Control No. 3064-0225). The FDIC's Form PS-01 and the OCC's Form PS-01 are closely comparable instruments. Both comprise eight schedules, A through H, addressing the same subject matter. Both are completed with daily data across a reporting period running from 12:00:00 a.m. Eastern each Wednesday to 11:59:59 p.m. Eastern the following Tuesday; both are filed each Wednesday by 5:00 p.m. Eastern; both impose a five-calendar-day amendment obligation, a GAAP preparation basis and the same rounding convention. Schedule A items 1 through 5 are specified in substantially identical terms, as is the footnote defining trading volume. Schedule B items 1 and 2 are likewise substantially identical, including the nine-column structure of item 1. Schedules C through H address the same asset categories with the same column structures. The forms diverge in particulars: the FDIC's Schedule A contains an ongoing capital item the OCC's does not; the OCC's Schedule B item 3.c measures average redemption time to the initiation of a transfer while the FDIC's measures to the provision of monetary value; and the FDIC's Schedule C separately reports a reserve asset subtotal, repurchase agreement liabilities and a total, where the OCC's reports a single total.

The FDIC estimates sixteen hours for implementation and two hours per ongoing weekly response. The OCC estimates sixteen hours for initial set-up and one hour per ongoing weekly response.

The Foundation respectfully submits that the more instructive observation is not the difference between the two ongoing figures but a feature common to both. The FDIC applies the same sixteen-hour implementation estimate and the same two-hour ongoing estimate to Form PS-01a — an abridged three-schedule form completed on a weekly rather than a daily basis — as it applies to the full eight-schedule daily form. An estimate that does not vary across instruments of materially different scope has not been derived from either instrument. The OCC's notice states expressly that its own figures were re-published from the March 2, 2026 notice for informational purposes, and so were not derived from the forms published in June. On the present record, no published ongoing estimate in either collection appears to have been derived from the instrument it measures. The Foundation accordingly invites the OCC to derive an estimate from Form PS-01 as published, rather than to reconcile its figure to the FDIC's.

The Foundation respectfully requests that the OCC derive the burden estimates for proposed sections 15.14(h), 15.14(i) and 15.31(b)(2) from the forms as published; include an estimate of capital and start-up costs; and publish the revised estimates in the 30-day notice contemplated by

the present notice, so that they are available for comment before the collection is submitted to the Office of Management and Budget.

VIII. Scaled Reporting for Smaller Issuers

The proposed collection applies a single eight-schedule form, completed with daily data and filed weekly, to every OCC-supervised PPSI and foreign payment stablecoin issuer, without regard to outstanding issuance or transaction volume. The OCC's own respondent estimate of 29 contemplates a population that will include newly licensed issuers whose outstanding issuance in their first reporting periods will be a very small fraction of that of the largest issuers.

The FDIC has proposed a different approach for the population it supervises. In its notice of July 20, 2026 it proposed two weekly forms: Form PS-01, with eight schedules completed with daily data, and Form PS-01a, an abridged form with three schedules completed on a weekly basis. A PPSI with less than \$1 billion in total outstanding issuance value as most recently reported, and less than \$100 million in average daily transaction volume in the prior month, would be eligible to file Form PS-01a, with the FDIC retaining the ability to require the full form on the basis of supervisory need in circumstances it expects to be infrequent. The FDIC has invited comment on whether those eligibility criteria are appropriate.

The Foundation respectfully submits that a scaled approach would serve the OCC's supervisory purpose as effectively as the full form does at small scale, and would serve it better in one respect. An issuer with de minimis outstanding issuance that devotes its initial engineering capacity to producing 1,400 address-level observations each week is unlikely to produce data of higher supervisory quality than that same issuer's total supply, issuance and redemption figures, which are exact. Calibrating the collection to scale directs the reporting effort of the smallest issuers toward the items that are both accurate and material.

A scaled approach would also reduce divergence between the reporting regimes applicable to OCC-supervised and FDIC-supervised issuers of comparable size, which the Foundation submits is desirable for issuers and for the vendors serving both supervised populations.

The Foundation respectfully requests that the OCC adopt a short-form weekly report for smaller issuers, with eligibility criteria comparable to those proposed for FDIC Form PS-01a and with the OCC retaining the ability to require the full form on the basis of supervisory need; and that any volume-based eligibility criterion be defined by reference to primary market issuance and redemption, which every reporting issuer generates directly, rather than by reference to a trading or transfer volume measure that would import into the eligibility test the difficulties described in Section IV.

IX. Format of Submission, and Two Further Matters

Format. The notice states that the OCC expects to use XML or another format for the submission of reported data in order to enhance the usability of the data, and invites comment on the best format. The Foundation supports submission in a structured, machine-readable format, and submits that the specification of that format is the single most consequential burden-minimization measure available under item (d), as well as a significant part of the gap between the published estimate and the effort the forms as specified would require.

The Foundation respectfully requests that the OCC (i) publish the submission schema and its data element definitions together with the final forms rather than after them, so that respondents build once against a known specification; (ii) provide a validation utility and a test submission window through BankNet in advance of the first live reporting date; and (iii) align data element definitions with the structured format the FDIC adopts for its corresponding collection where the elements are common. The FDIC has stated that it expects to use a structured format and has sought comment on which would be most effective. Given the correspondence between the two forms described in Section VII, common data element definitions would materially reduce implementation cost for issuers and for vendors serving both supervised populations, with no loss of supervisory content to either agency.

A drafting matter in the Schedule F instructions. The general instructions to Schedule F direct respondents to complete columns A through J for items 1.a, 1.b and 1.c. Schedule F as published contains items 1.a and 2.a; items 1.b and 1.c do not appear, and neither of the items that does appear extends to a column J. The corresponding instruction in the FDIC's Form PS-01 reads consistently with its schedule. The Foundation respectfully requests that the instruction be conformed to the schedule as published.

An item that may merit inclusion. FDIC Form PS-01a collects a weekly minimum, maximum and average reserve asset coverage ratio. That measure — reserve assets against outstanding issuance — does not appear on either full weekly form, although it is derivable from data both full forms already collect. The Foundation respectfully submits that collecting it expressly would enhance the utility of the information collected under item (c) at negligible additional burden, and would place the most direct indicator of reserve adequacy on the face of the form rather than leaving it to be computed.

X. Other Questions Raised in the Notice

For completeness, the Foundation classifies the remaining questions raised in the notice as follows.

Weighted average maturity and weighted average life (Schedule C, columns G and H). No position.

Treatment of treasury stablecoins (Schedule B). No modification requested. The Foundation notes that the forms as published appear already to adopt the customer-facing treatment the notice describes as one of the two approaches under consideration: Schedule B item 1, column B expressly excludes payment stablecoins held by the reporting issuer and not yet issued to customers, and column D captures placement into issuer-controlled inventory. The Foundation supports that treatment as specified and takes no position on further disaggregation.

Exclusion of trades lacking sufficient volume, frequency or recency (Schedule B). Supported in principle. The Foundation respectfully requests that any such limitation be specified together with the venue-population and methodology questions raised in Section VI, since the two interact.

Additional information regarding tokenized assets (Schedule C). No position.

Treatment of U.S. and foreign cash balances (Schedule D). No position. The reporting treatment follows from the OCC's resolution of the reserve-eligibility question raised at 91 FR

10202 concerning deposits at foreign depository institutions. The Foundation has not taken a position on that question and takes none here.

Whether PPSIs should be required to complete the proposed reporting forms only, or the proposed reporting forms together with the Consolidated Reports of Condition and Income and other reporting obligations. The Foundation respectfully requests that an OCC-supervised PPSI whose activities are limited to payment stablecoin issuance and directly related activities be required to complete the proposed reporting forms only, in lieu of the Consolidated Reports of Condition and Income. Those reports are designed for institutions with lending, deposit-taking and trading activities; the balance sheet of a PPSI of this description comprises reserve assets, capital and a limited operating book, which proposed Form PS-02 is designed to capture. Requiring both would report the same financial condition twice in two taxonomies. The Foundation takes no position on other reporting obligations not specified in the notice.

Uninsured national trust banks opting into proposed 12 CFR part 15. No position. This question concerns a population outside the Foundation's scope.

Fair value reporting on quarterly Schedule B; off-balance sheet exceptions on quarterly Schedule C. No position.

XI. Conclusion and Modifications Respectfully Requested

DDCP Foundation, Inc. submits this comment as protocol steward. The Foundation supports the substantial majority of the proposed collection, and respectfully requests the following modifications.

1. That Schedule A item 1 not be retained in its present form, on the ground that it does not deliver the holder-composition information the notice describes; that the primary market channel concentration measures described at Section V be collected in its place, the Foundation noting expressly that those measures are not a measure of holdings and that holdings concentration is not available with precision from any source; and that, in the alternative, if an address-level collection is retained, it be constructed using the two mechanisms described at Section V — an enumeration subject to a materiality threshold, an aggregate line for the remainder of the population, and a stated total — on a weekly rather than a daily basis, and that any such enumeration be limited to addresses whose balances the reporting issuer can determine from its own records or from data publicly available on the ledger.
2. That Schedule A item 2 be removed and Schedule A items 3 and 4 retained; that the measure not be redefined by reference to activity observable on the ledger, however described; and that, if a per-counterparty activity measure is retained, it take the form described at Section V.
3. That the venue population and computation methodology for Schedule B items 2.a through 2.e be specified; that item 2.e be limited to centralized venues or a defined proxy specified for automated market maker venues; and that reporting from an identified third-party market data source be confirmed as permissible. The Foundation does not request the removal of these items.

4. That the burden estimates for proposed sections 15.14(h), 15.14(i) and 15.31(b)(2) be derived from the forms as published, that an estimate of capital and start-up costs be included, and that the revised estimates be published in the 30-day notice.
5. That the OCC adopt a short-form weekly report for smaller issuers, with eligibility criteria comparable to those proposed for FDIC Form PS-01a, and that any volume-based eligibility criterion be defined by reference to primary market issuance and redemption.
6. That the submission schema and data element definitions be published with the final forms, that a validation utility and a BankNet test submission window be provided in advance of the first live reporting date, that data element definitions be aligned with the FDIC's corresponding structured format where the elements are common, and that the Schedule F general instruction be conformed to the schedule as published.
7. That an OCC-supervised PPSI whose activities are limited to payment stablecoin issuance and directly related activities be required to complete the proposed reporting forms in lieu of the Consolidated Reports of Condition and Income.

The Foundation appreciates the OCC's consideration of these comments and would welcome the opportunity to provide any further information that would assist the agency.

Respectfully submitted,

DDCP Foundation, Inc.
